

PRODUCTION ACCELERATION CENTER

Accelerate your Production

Our dedicated team of Application, Material, and Process Engineers will consult with you and your team to determine the needs and goals of your organization. We are able to assist your team with pre-sale, post-sale, application changes over the life cycle of the project, process control, and materials science.

Our PAC (Production Acceleration Center) provides the space, infrastructure, and expertise to support you in your path to STEP produced parts. This is where your 3D prints for the Production Assessment Program are built. Following that program you may want to validate a larger number of parts which we can print here or work with our production partners. Or, you may purchase limited time on the system to produce parts, learn more, or accelerate your production as a facility bridge after you have purchased an SVP but before your facility is ready. Our PAC provides many flexible options to help you accelerate your agile business.

Our PAC provides space, infrastructure, and expertise to support you on your path to parts produced by STEP technology.

PRODUCTION ACCELERATION CENTER

Welcome to the Production Acceleration Center

The SVP Experience Center

The SVP System can be used on a space-available basis for you to accelerate your production manufacturing and to explore how agile manufacturing can add value to your operations .

Post-Production Lab

We have support removal, media-blasting and vapor smoothing capabilities to providing you with options for basic finishing needs.

Metrology and Test Lab

We can scan your STEP printed parts with our Keyence scanner for surface roughness and measurements, perform material property testing and provide a quality report.

Production Parts Showroom

See first-hand parts printed on the SVP system. All are real-world examples of applications that show value for your organization.

Training Room

Our training space is located adjacent to the SVP system, making it easy to have classroom training, discussions, meetings and then work on the SVP system.

Conference Room

Meet with our team, or if a smaller part of your team is on-site we can easily provide you with a home base connection.

PAC Offerings

Production Validation

After Production Assessment Program, you may wish to continue to validate a larger, but limited volume through our facility. The PAC can provide the facility and expertise you need. We can work with you to then move production to a part provider partner, or if you choose to purchase an SVP, we can assist you with the transition.

Facility Bridge

Build-out of your facility can be a time limiting-factor. The Facility Bridge allows you to order your SVP, and when complete, take full ownership with the SVP 'shipped' to you at our facility. This offering is only on a space-available basis but can give you added flexibility. You lease our floorspace, utilities and support removal services and can get running on your applications faster while you prepare your facility for up to (3) months (on a space available basis). From there, it is up to you. Take advantage of our on-site expertise and facility which allows you to start learning how to run and maintain the system. This gives you the ability to connect closely with our team if needed or run securely and separately.

Application and Production Acceleration

On a space-available basis, lease one of Evolve's SVP systems at our headquarters after your SVP purchase. This allows you to get a head start on your application & process development, training, and use of the system, minimizing the impact of lead-time on the system build so that when your SVP arrives, you can carry the knowledge learned back to your facility on your SVP and start seamlessly. This is for a maximum time up to (3) months to account for build and shipping schedules when you need to meet your objectives faster. Lease of an Evolve SVP unit is subject to separate Terms and Conditions.

Emerging R&D Applications

Lease time on our system and utilize our personnel to drive cutting-edge applications. This might stretch our limits of the applications such as multi-material but is using nearly released or released materials and hardware, but in new ways or for new applications. Customer can use this as a conceptual proof point for their board or investors, or early small run production on unique applications. This is usually a shorter-term arrangement and may follow from our basic Customer Parts Program.
